## Producers Reminded That AAA Payments Will Not Be Earned Unless Adapted Seed is Used

Participants in the 1937 Agricultural Conservation Program were reminded today by the Agricultural Adjustment Administration that the program requires them to sow adapted seed in order to qualify for soil-building payments for seeding red clover and alfalfa or mixtures of these seeds.

This is a strict provision of the 1937 program, affecting all agricultural regions of the United States.

Soil-building payments will be made in all regions for seeding adapted domestic and Canadian clover and alfalfa and mixtures containing such clover and alfalfa at the rates and under the conditions stated in the program. Such payments will not be made in any region for seeding unadapted seed whether of domestic or imported origin.

The seeding of imported (except Canadian) or unadapted domestic seed or mixtures containing these seeds will not classify land as soil-conserving in the North Central Region where most red clover and considerable alfalfa seed are harvested. Soil-building payments will not be made for the seeding of unadapted seed in the North Central Region whether imported or domestic, and the \$3.00 soil-conserving payment will not be made even if there is a stand of red clover or alfalfa this fall from the seeding of unadapted seeds.

North Central Region states are:

Nebraska, South Dakota, Minnesota, Iowa, Missouri, Wisconsin, Illinois, Michigan, Indiana and Ohio.

In all other states, land seeded to clover, alfalfa or mixtures of these seeds from any source will be classified as soil-conserving if state and county committees determine in late summer and early fall that there is a stand from the seed which will survive the winter. The land on which good stands are obtained will be counted in determining the diversion payment but, as has been stated, the use of such seed will not qualify for any soil-building payment.

State committees may determine in advance of planting the kinds of clover and alfalfa seeds sufficiently adapted to survive winter.

If farmers outside the North Central Region use in mixtures clover and alfalfa seed imported from countries other than Canada, they should be sure that in the mixtures there is enough other seed which will grow well in the region to insure a good stand.

Some misunderstanding has resulted from the fact that although the Department of Agriculture does not deem imported red clover and alfalfa seed from some origins "not adapted for general agricultural use", it does deem it to be of such limited adaptation that its use in connection with the Agricultural Conservation Program should not be encouraged.

Under the Federal Seed Act, the Secretary of Agriculture may determine, after public hearings, that red clover or alfalfa seed imported from certain countries "is not adapted for general agricultural use in the United States". Under the law, 10 percent of such seed must be stained red. One percent of all other imported red clover or alfalfa seed of known origin, except that from Canada, must be stained green. By implication, green-stained seed, since not being legally determined "not adapted", has been assumed by some to be "adapted". It should be recognized, however, that "adapted" is a relative term and that seed may be well adapted, fairly well adapted, poorly adapted, or entirely unadapted to a given region.

Extensive experiments have shown that seed of many foreign origins permitted entry with green staining under the Federal Seed Act is not as well adapted to important producing regions as certain strains of native stocks. Furthermore, the North Central Region is an important area for the production of domestic red clover and alfalfa seed. The use in this area of poorly adapted strains, whether of domestic or foreign origin, would present a hazard of contamination to the well-adapted seed stocks both through mixture and hybridization.

Consequently, the Agricultural Conservation Program seeks to protect the yields of red clover and alfalfa in the important red clover and alfalfa-producing regions.
